fivethirtyeight

Datasets and code from the <u>fivethirtyeight</u> website. (Not officially published by 'FiveThirtyEight').

```
# install.packages("fivethirtyeight")
library(fivethiryeight)
```

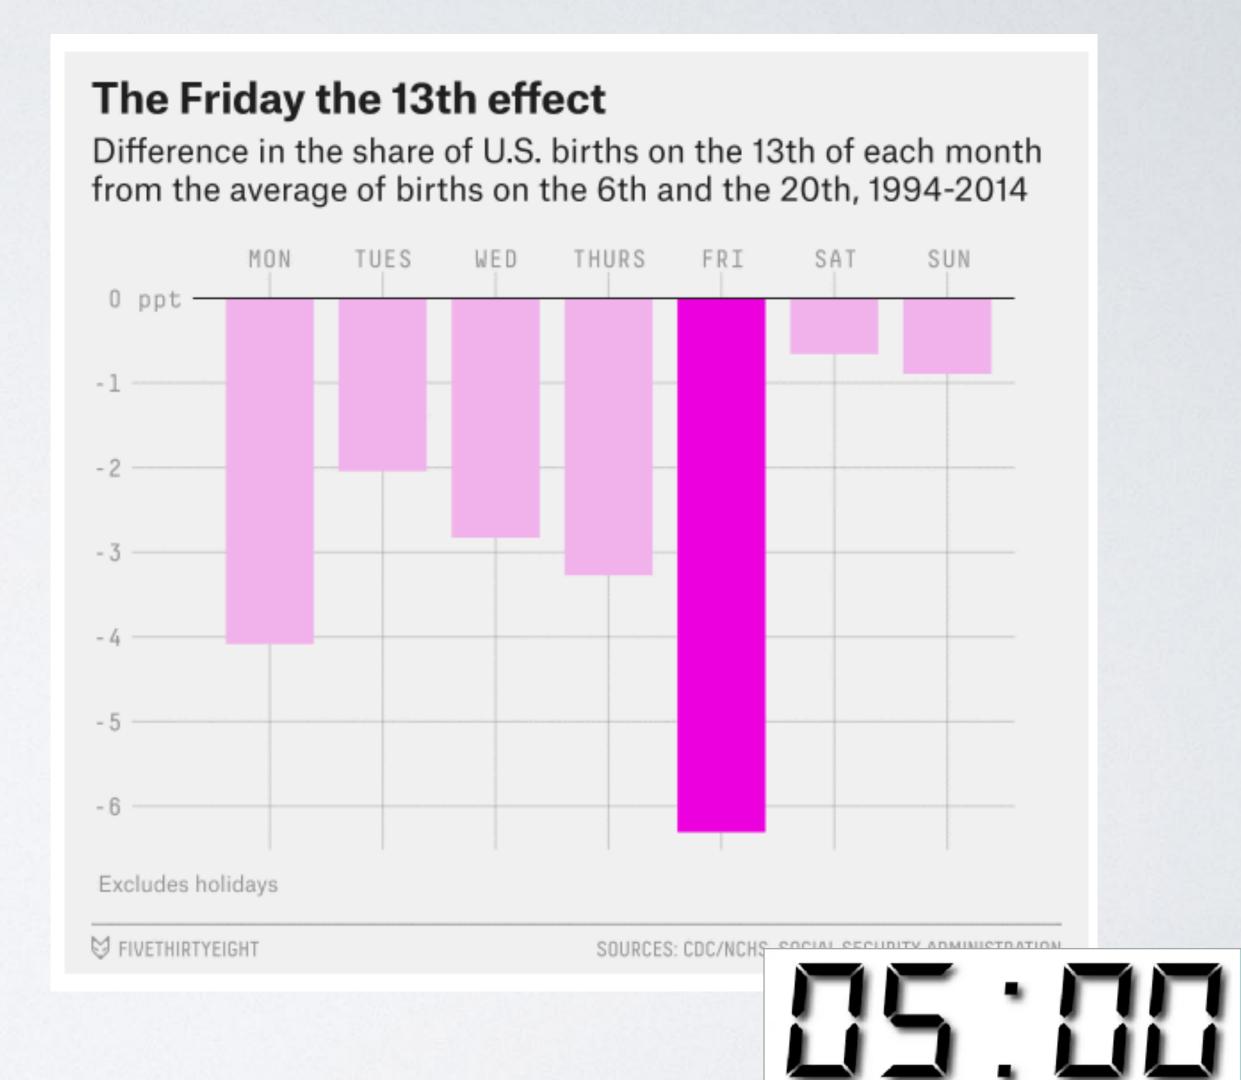

https://fivethirtyeight.com/features/some-people-are-too-superstitious-to-have-a-baby-on-friday-the-13th/

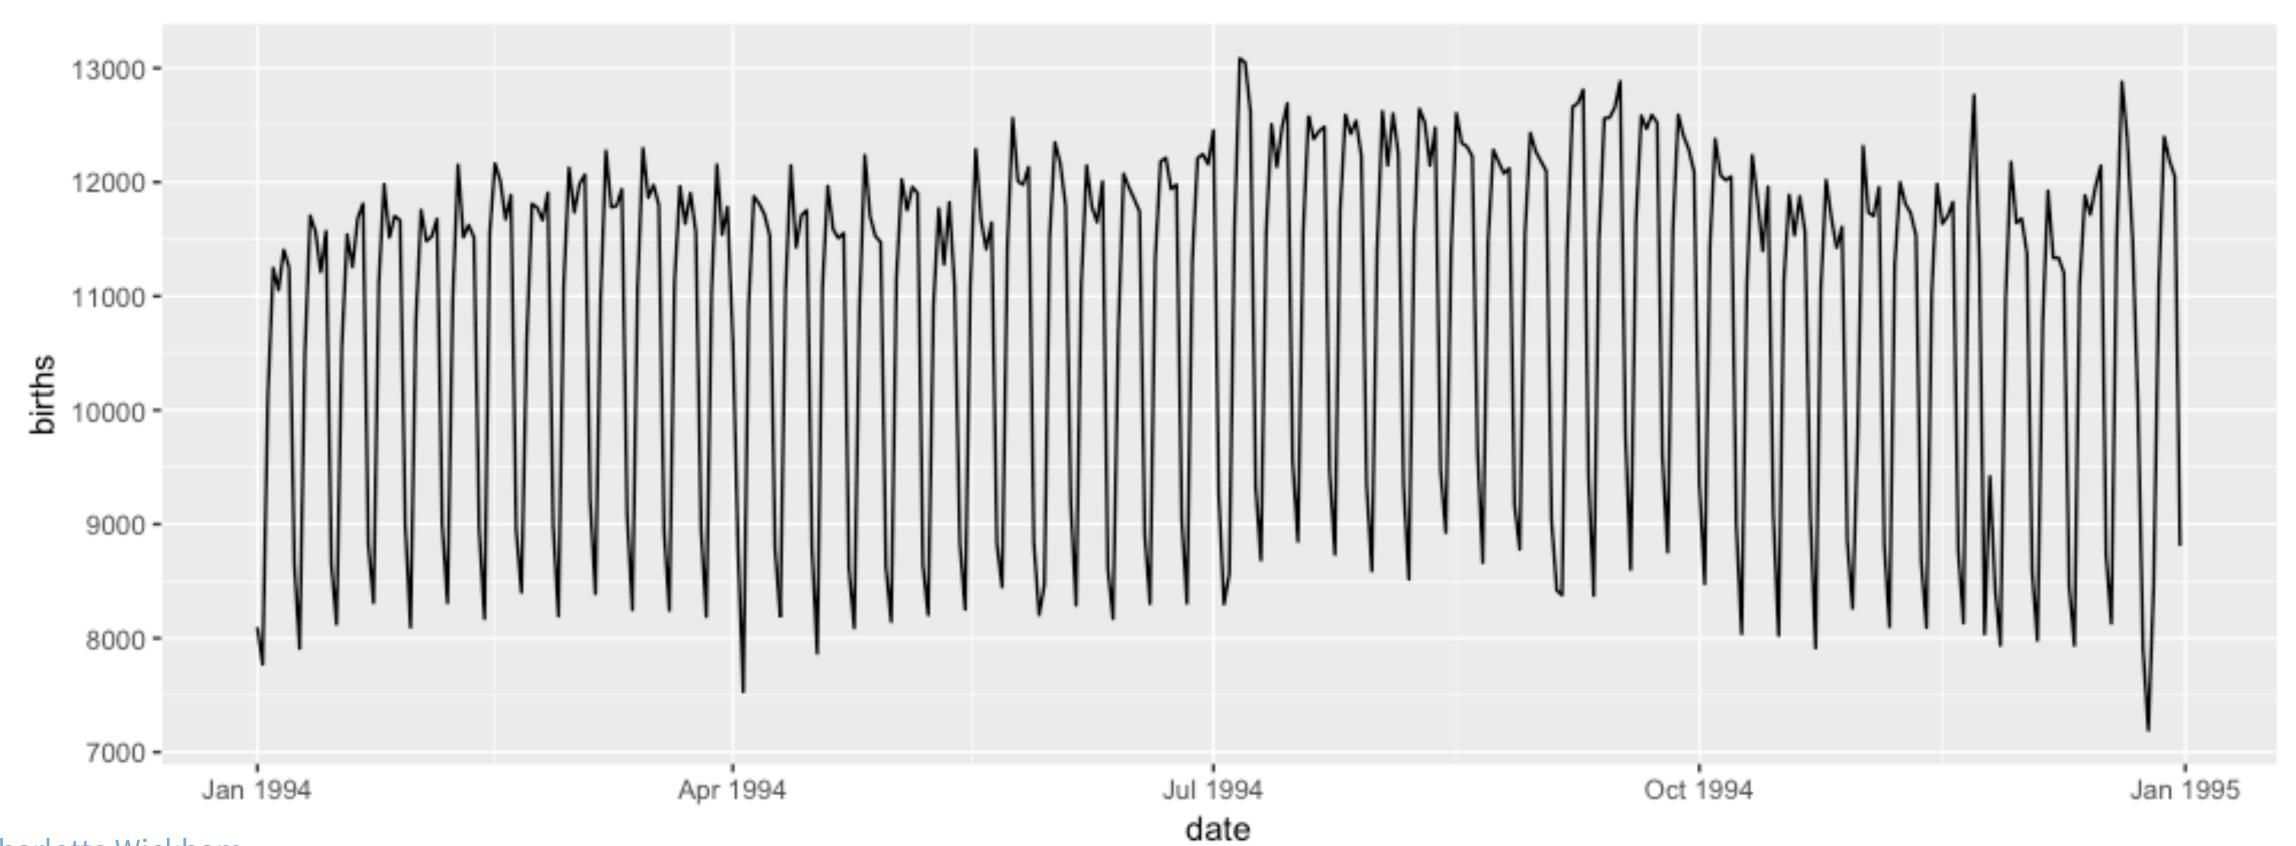

Can we replicate this plot?

Take a look at US_births_1994_2003

With your neighbour, brainstorm the steps needed to get the data in a form ready to make the plot.

```
US_births_1994_2003 %>%
filter(year == 1994) %>%
ggplot(mapping = aes(x = date, y = births)) +
    geom_line()
```

One such process

Get just the data for the 6th, 13th, and 20th

Calculate variable of interest:

(For each month/year):

Find average births on 6th and 20th

Find *percentage difference* between births on 13th and average births on 6th and 20th

Average percent difference by day of the week

Create plot

Extract just the 6th, 13th and 20th of each month.

(select(-date) is removing the date column, because it gets in the way later and is redundant).

US_births_1994_2003 %>%
 select(-date) %>%
 filter(date_of_month %in% c(6, 13, 20))

				<i>□</i>
year <int></int>	month <int></int>	date_of_month <int></int>	day_of_week <ord></ord>	births <int></int>

One month

Two options for arranging the data

Option 1 days in rows

year <int></int>	month <int></int>	date_of_month <int></int>	day_of_week <ord></ord>	births <int></int>
1994	1	6	Thurs	11406
1994	1	13	Thurs	11212
1994	1	20	Thurs	11682

Option 2
days in cols

year <int></int>	month <int></int>	day_of_week <ord></ord>	6 <int></int>	13 <int></int>	20 <int></int>
1994	1	Thurs	11406	11212	11682

Which one is tidy?

× ×

Which arrangement is tidy?

(**Hint:** think about our next step "Find the percent difference between the 13th and the average of the 6th and 12th". In which layout will this be easier using our tidy tools?)

Option 1

year <int></int>	month <int></int>	date_of_month <int></int>	day_of_week <ord></ord>	births <int></int>
1994	1	6	Thurs	11406
1994	1	13	Thurs	11212
1994	1	20	Thurs	11682

Next step, we'd have to write a custom function to summarize these three rows, relying on order, or subsetting to reference dates.

NOT TIDY.

Option 2

year <int></int>	month <int></int>	day_of_week <ord></ord>	6 <int></int>	13 <int></int>	20 <int></int>
1994	1	Thurs	11406	11212	11682

Next step, we can use mutate directly referring to columns for days. TIDY!

Tidy the filtered data to have the days in columns.

E.g.

						<i>□</i> × ×
	year	month	day_of_week	6	13	20
	<int></int>	<int></int>	<ord></ord>	<int></int>	<int></int>	<int></int>
1	1994	1	Thurs	11406	11212	11682
2	1994	2	Sun	8309	8171	8402
3	1994	3	Sun	8389	8248	8243
4	1994	4	Wed	11811	11428	11585
5	1994	5	Fri	11904	11085	11645
6	1994	6	Mon	11130	10692	11337
7	1994	7	Wed	13086	12134	12378
8	1994	8	Sat	9336	9474	9646
9	1994	9	Tues	11448	12560	12584
10	1994	10	Thurs	12017	11398	11876
1-10 of 1	20 rows		Previous	1 2 3	4 5 6	12 Next

US_births_1994_2003 %>%
 select(-date) %>%
 filter(date_of_month %in% c(6, 13, 20)) %>%
 spread(date_of_month, births)

						~ ^
	year <int></int>	month <int></int>	day_of_week <ord></ord>	6 <int></int>	13 <int></int>	20 <int></int>

1-10 of 120 rows

Previous 1 2 3 4 5 6 ... 12 Next

Now use mutate() to add columns for:

- The average of the births on the 6th and 20th
- The percentage difference between the number of births on the 13th and the average of the 6th and 20th

(Hint: You need to use backticks `around the days, e.g. `6`, `13` and `20` to specify the column names)

```
US_births_1994_2003 %>%
  select(-date) %>%
  filter(date_of_month %in% c(6, 13, 20)) %>%
  spread(date_of_month, births) %>%
  mutate(
    avg_6_20 = (`6` + `20`)/2,
   diff_13 = (13) - avg_6_20) / avg_6_20 * 100
```

1 row

Summarize each day of the week to have mean of diff_13.

Then, recreate the fivethirtyeight plot. (**Hint:** if you specify a y aesthetic with **geom_bar()** you'll need to add stat = "identity" as an argument.

(Extra challenge: use a different summary, and/or another way of visualizing the data)

```
US_births_1994_2003 %>%
  select(-date) %>%
  filter(date_of_month %in% c(6, 13, 20)) %>%
  spread(date_of_month, births) %>%
  mutate(
    avg_6_20 = (`6` + `20`)/2,
    diff_13 = (13) - avg_6_20) / avg_6_20 * 100
  ) %>%
  group_by(day_of_week) %>%
```

    geom_bar(stat = "identity")
```

Extra Challenges

If you wanted to use the US_births_2000_2014 data instead, what would you need to change in the pipeline? How about using both US_births_1994_2003 and US_births_2000_2014?

Try not removing the date column. At what point in the pipeline does it cause problems? Why?

Can you come up with an alternative way to investigate the Friday the 13th effect? Try it out!
